

Optimizing Task Tracking Concept for Efficiency

Atanu Paul | 3 Apr 2025 | Nuro SimTeacher V2

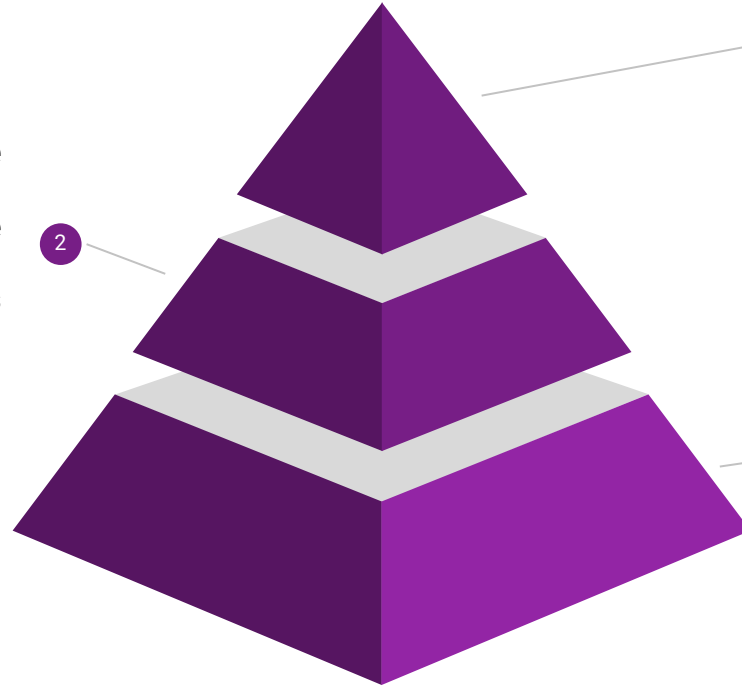

Problem Statement

- The tracker is too bulky with all 22 TMs updating in the same sheet.
- Frequent crashes and slow updates.
- Difficult to track and manage data efficiently.

Proposed Solution

- Each TM will have a separate sheet to update their task details.
- A master sheet will automatically consolidate summary data.
- Reduces bulkiness, improves performance, and ensures smooth tracking.

Workflow Overview

Import to Master Sheet

Each individuals sheet's summary will imported to a Master sheet from where anyone can easily visualize daily and weekly reports like now

Daily summary update

Daily Summary Will update in other tab of each individual sheets

Different Sheets for each individual

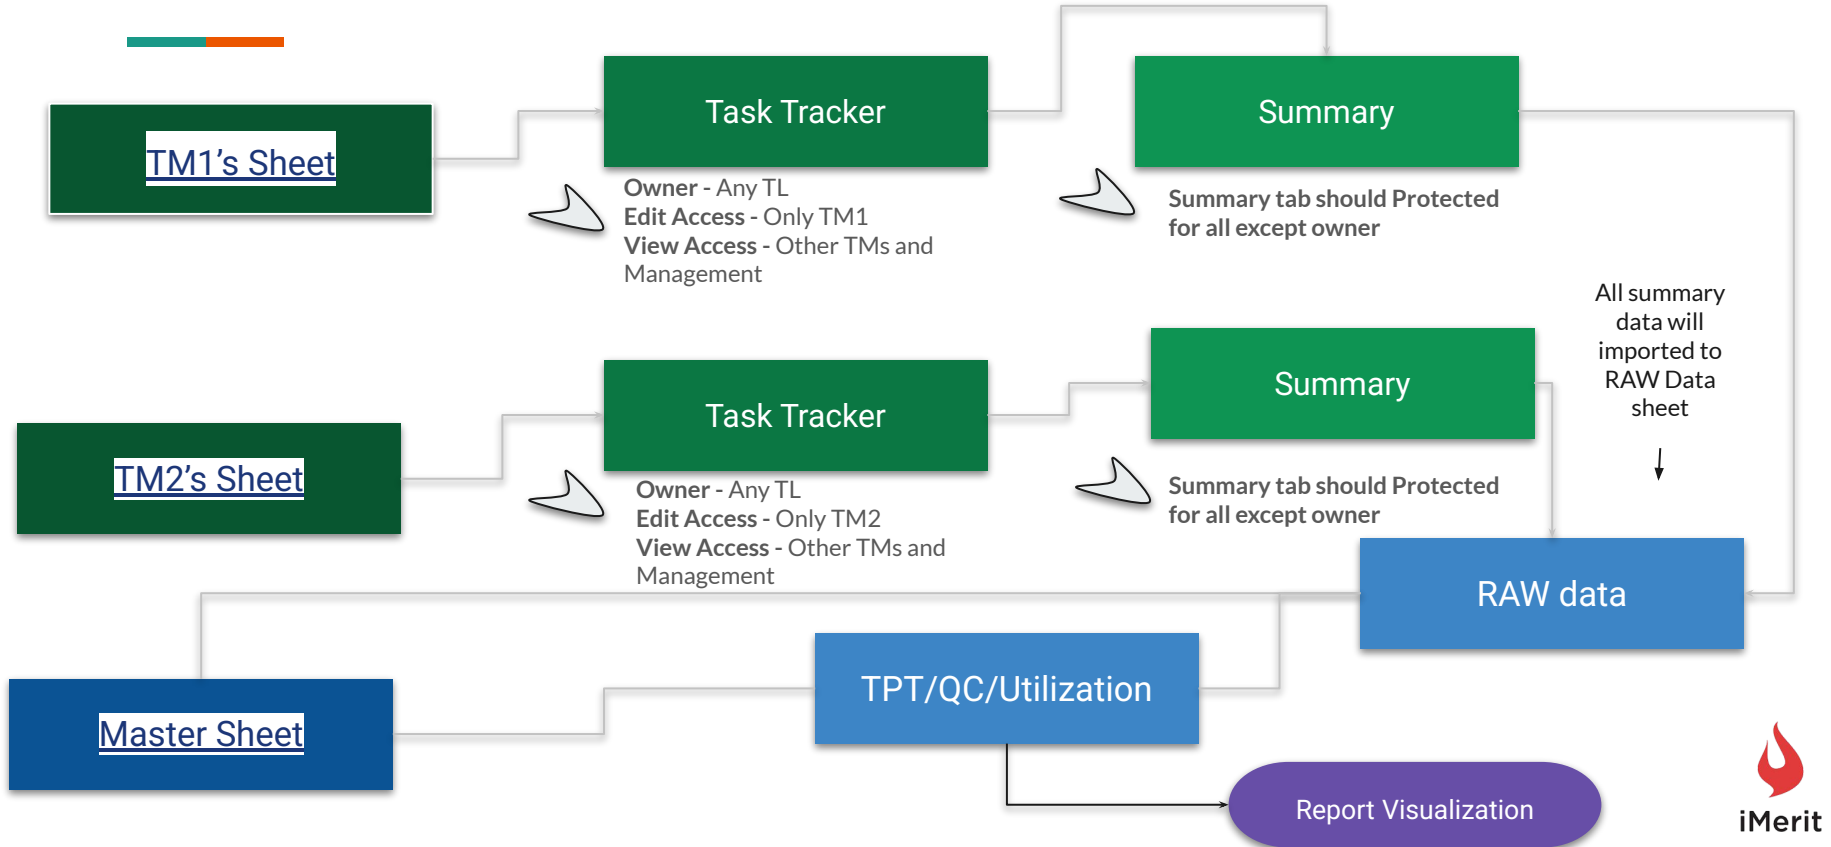

TMs updating their individual Task Tracker with their daily task as similar as they are doing right now

Advantages of the New Approach

- Faster and more efficient updates.
- No crashes or slowdowns.
- Easy tracking and monitoring of task progress.
- Scalable and manageable structure.

In hand Example

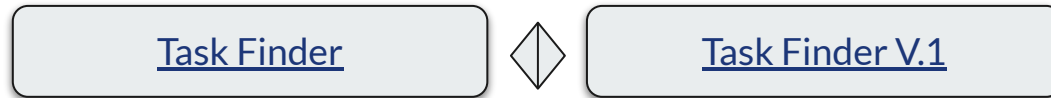

Challenge Identified:

Searching for a specific **Task ID** or identifying who worked on it is difficult because it requires manually checking each TM's sheet one by one.

Possible Solution:

I have created a **Search Sheet** where users can simply enter a **Task ID** or **Task Link**, click **Search**, and instantly view all matching records from across all sheets in one place

N.B. avg. execution time: 30 sec as i have connected 50k rows contained sheet

Challenge Identified:

As we can see, not all team members are able to properly fill in their TPT or total hours. Manager have to go into each individual sheet to make corrections, instead of managing everything in one place.

Possible Solution: I have created a Tab namely [Bulk Update](#) in following format -

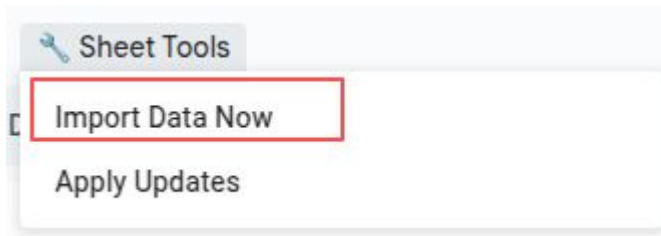

Sheet Link	Tab Name	Range to Update	Changed Value
https://docs.google.com/spreadsheets/d/1Q3TW6M	Test	c5:D98	Great
https://docs.google.com/spreadsheets/d/1csgEd_rF	Check	A3:B7	Colourful
Import Data Now			

Using [Apply Updates](#) this tool anyone can modify any cell with required value. Also the access should be restricted to the TL only .

Challenge Identified:

Multiple (22) importrange significantly reduce the sheet performance and may create #REF error anytime.

Possible Solution: The IMPORTRANGE function has been replaced with an Apps Script that updates the Master Sheet every minute using a time-driven trigger. The previous issue of data disappearing during updates has been resolved by implementing a method that only updates changed data instead of clearing and rewriting everything. Additionally, the Master Sheet now includes a custom manual trigger that allows users to instantly refresh the data without waiting for the scheduled update.

Challenges Identified

Each sheet have two importrange functions which was used to update QC and Audit Score. Daily they are looks #REF error as large number of data set need to import.

Possible Solution: A script has been created to automatically import data from both the QC and Audit sheets using a 30-minute time-driven trigger. It also filters individual data based on the references provided in the User tab.

[Sheet Link](#)

User Sheet Architecture

Labeler name for QC
Task Filter

User name for Audit
Task Filter

Defined TPT can be updated through bulk
changes

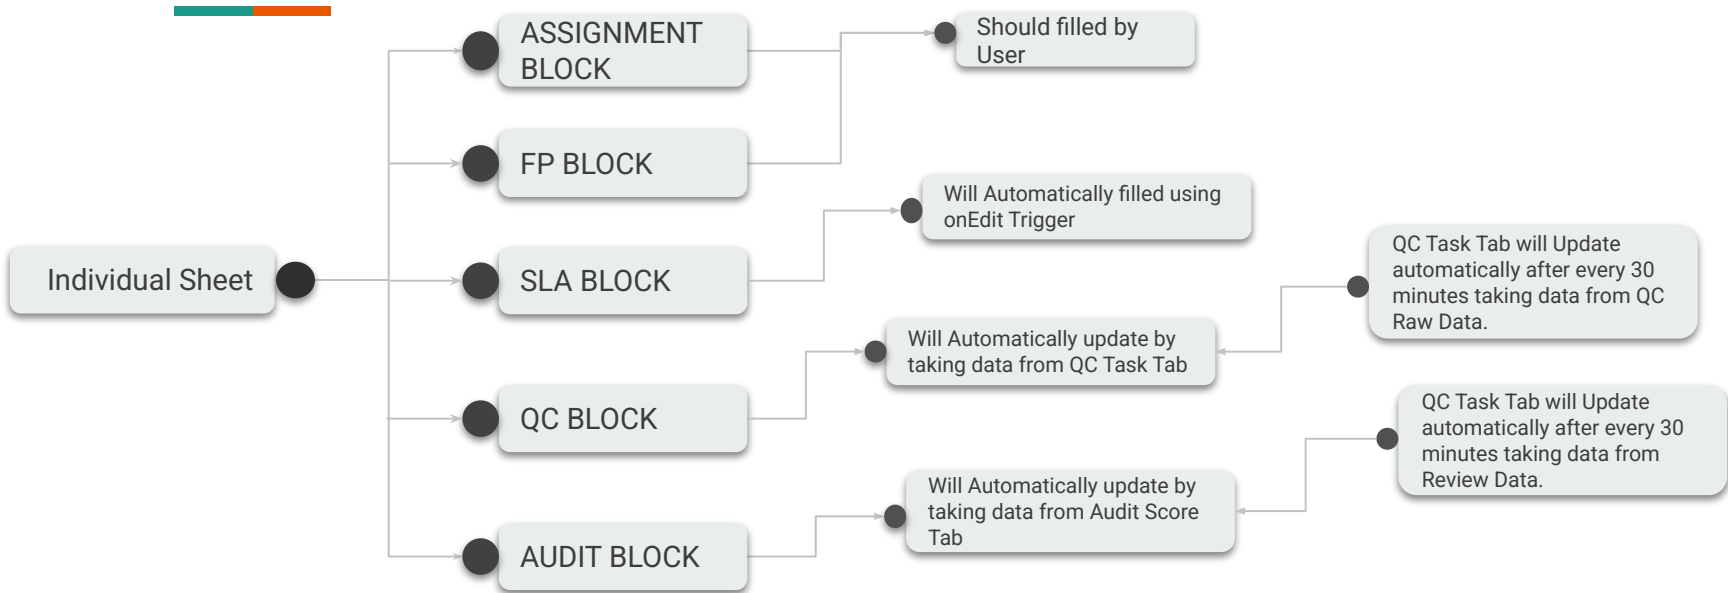

anag	amit.nag@imerit	12
↑ SET TPT ↑		

Add 1000 more rows at the bottom

+ ≡ 2025 Summary Downtime Tracker QC Task Audit Score User

[Sheet Link](#)

Now, each individual team member's sheet will automatically update with their respective QC and Audit scores in place of all TMs score which will reduce sheet space and loading issue as well.
